SUMMARY

This report is the result of an assignment where the objective is "to assist the HIMA Iringa project in assessing possibilities of introducing computer support to the monitoring of project activities and outputs of these".

A computerisation of the existing monitoring activities is recommended.

Within the project there is now some experience in datacollection and presentation of monitoring information due to the work when preparing the annual plan and the progress reports. The computerisation is a natural continuation of the process of making more and more structured presentation in these reports.

The proposal for computer support for the monitoring at HIMA Iringa is a proposal for introducing a system specifically designed for the project. A monitoring system which will support the existing ideas, needs and requirements for monitoring, but also will assist in improved reporting and analysis of the collected data.

The proposal for implementation of the system is a proposal where the user involvement is high and the exact layout of the system is very flexible.

This specification report will present

- the User requirements and objectives
- an overall description of the proposed system
- draft database structure
- requirements to users and hardware
- draft implementation plan
- draft timeschedule
